Q2

Multiple thread classes

20 marks

Question:

Write a Java program to create three different thread classes to perform different operations on the same number.

Create the following classes:

PrimeThread → Check whether the given number is prime.

FactorialThread → Find the factorial of the given number.

ReverseThread → Find the reverse of the given number.

Each class should extend the Thread class and override the run() method.

Create and start all three threads from the main() method.

Input: 7

Expected Output:

Prime: 7 is a prime number

Factorial: 7! = 5040

Reverse: Reverse of 7 = 7

Note: Since the threads execute concurrently, the order of output may vary.

Your Code

```
1 import java.util.*;
2
3 public class Main {
4
5     public static void main(String[] args) throws InterruptedException
6         Scanner sc = new Scanner(System.in);
7         int n = sc.nextInt();
8
9         PrimeThread t1 = new PrimeThread(n);
10        FactorialThread t2 = new FactorialThread(n);
11        ReverseThread t3 = new ReverseThread(n);
```

Input

7

Output

Prime: 7 is a prime number
Factorial: 7! = 5040
Reverse: Reverse of 7 = 7

Q1 Multiple Threads Using a Single Class

10 marks

Topic: Thread class, multiple threads, if-else

Question:

Write a Java program using a single thread class to create three threads named Prime, Armstrong, and Reverse.

The program should contain a common run() method. Based on the thread name, use if-else statements to perform the following operations on a given number:

Prime → Check whether the number is prime.

Armstrong → Check whether the number is an Armstrong number.

Reverse → Find the reverse of the number.

Create and start all three threads from the main() method.

Input: 153

Expected Output:

Prime Thread: 153 is not a prime number

Armstrong Thread: 153 is an Armstrong number

Reverse Thread: Reverse of 153 = 351

Your Code

```
1 import java.util.*;
2
3 public class Main {
4
5     public static void main(String[] args) throws InterruptedException
6         Scanner sc = new Scanner(System.in);
7         if (!sc.hasNextInt()) return;
8         int n = sc.nextInt();
9
10        MyThread t1 = new MyThread("Prime", n);
11        MyThread t2 = new MyThread("Armstrong", n);
```

Input

153

Output

Prime Thread: 153 is not a prime number
Armstrong Thread: 153 is an Armstrong number

Q3 Thread Synchronization

10 marks

opic: synchronized, shared resource, race condition

Question:

Write a Java program to demonstrate thread synchronization using a shared Counter object.

Create a class Counter containing an integer variable count, initially set to 0.

Create two threads, ThreadA and ThreadB. Both threads should increment the same count variable 1000 times.

Implement the increment() method using the synchronized keyword so that only one thread can modify the counter at a time.

After both threads complete their execution, display the final value of count.

Expected Output:

ThreadA completed

ThreadB completed

Final Count = 2000

Requirements:

Use a shared Counter object.

Both threads must access the same Counter object.

Use synchronized for the increment operation.

Use join() to ensure both threads finish before displaying the final count.

Your Code

```
1 public class Main {
2     public static void main(String[] args) throws InterruptedException
3         Counter counter = new Counter();
4
5         ThreadA t1 = new ThreadA(counter);
6         ThreadB t2 = new ThreadB(counter);
7
8         t1.start();
```

Input

stdin input

Output

ThreadA completed
